

Breaking The Trends

A.Yahya Yunus

Today's World some trends seems to need to have been broken
And some new trends needs to be taken

These trends can sometimes occur in the form
of the numbers in some fields of the life.

As the one of the most important aspect is to prevent waste, people have to reconsider to what can be done in a more effective way with the capabilities available.

The most noticable trend seems to come with the use of electronic environments.

There might come a many easiness to somebody's daily life like paying bills, registerings etc automatically..

And in many places around the world such works were enabled to be done by such a way.

So, as it is a real finely relivement to dailiy life and to the environment itself; people are supposed to use them if there is not another special reason.

Therefore,

The precautions to prevent wastefully spent time, effort and money can be taken in some way if Allah / God permits.

Than,

If there is no special reason, transporting long distances for paying bills etc. surely doesn't seem fine. Automatic payings are wide-spread. (surely, additionally, I do not suggest people to be taking part in the interest pool.)

Be On time

That is what many people might be in accordance with. (*..unless some abnormal happenings nesseciate otherwise*)

However, in terms of some training processes, some prefixed training hours might fail to be in accordance with the personal need.

This condition could especially happen in the aviation training hours. Because it is an expensive&expensing training, than the hours spent on air turns out to be important;

Than, people rather can consider about: flying for the hours or flying for the training. That is really crucial and people shouldn't be expected to fill a list of hours to take a prestije, and calling themselves a better pilot but rather they should incline on the purpose of the training if it were really the necessary condition.

So, the training flights should really fill the need, not only because to fill the proposed training flight hours.

Moreover, flight training and fighter plane training processes could be in a need of revision.

For instance, maybe, by the furthering of the technology; some of the old fighter pilot maneuvers could really have turned out to be somewhat unnecessary or somewhat dull.

New concepts might have been initiated.

Some older stuff could have been turned out to be somewhat fantasy.

Although, maybe the stuff might be in need, the tech should really be followed and being realistic, and taken the revision as required.

Not flown if unnecessary. It should also be in the interest of military activities to protect the environment in the proper manner.

The Heating

Maybe one of the most dull and silly condition still existing many places around the world is heating with less isolation.

Although, there were many isolation providing measures possible by today's facilities, why they do not be taken is really a fine question that is needed to be answered.

The policy here is a very important factor.

The leaders of the countries should do the proper actions in the lawsuit and should do the necessary regulations.

The regulations should be in supervision if necessary to minimise unisolated constructions.

Zero heating, or a heating by the un-polluting processes means a better environment..

The Transportation

Needless to say, -if there is no special reason- using public transportation is surely the better way to protect the environment.

Using of the Electronic Environment

As mentioned earlier, the usage of electronic environment (*using telephone or a pc or internet etc.*) to make some daily works (*rather than transporting for miles etc. to do them*) might be the better approach protecting the environment.

Usage of Effective Electric Appliances

Now, there were many energy efficient models of the appliances.

For instance,

Energy efficient bulbs..

Even further energy efficient led bulbs..

Energy efficient home appliances..

Energy efficient computer appliances..

and best : producing your electricity by green resources of the energy.

A Few Example

Here are some bulb examples:

There on the right is a filament bulb of 15 W as one of the lowest power consumer of the type.

And there on the right is a much more efficient light bulb. Although it consumes 20 W of energy, such ones might pass about 100 W of a filament bulb's light.

(but they are supposed not to be used momentarily like a few seconds.)

And My Selection

*There on the left is my selection.
(in 2009) That is a table lamp
with led light bulb. But it
consumes about just a few watts
of electricity. Changing the
conventional socket
by the led spot light socket,
and it turned out to be
a very efficient light bulb.
It is especially good
for the reading at night.
It is supposed to consume less than 4 watts.
And the leds are supposed to last longer.
Isn't it fine !*

Electric Generating

Practically speaking, by 2009 Nuclear energy generating seems to be an environment friendly solution.

Unless the generators by sun panels, by thermopowers, by windpower or by wavepower etc. do not catch up with the need in a reasonable manner, the nuclear, in many cases goes on to be the environment friendly solution. *

**it is true as long as there occurs no sabotage; bombing etc.of course and the left out material is kept as required.*

**Hoping from Allah / God that these
suggestions be followed
Thanks to Allah
and thank you for your viewing**
