

Some Suggestions About How To Establish Efficient Warming In Governmental Level

by A.Yahya Yunus
15-14.01.2009

In order to make the unisolated buildings coated with isolation, the government could establish some regulations as:

- Regulations to establish required isolation and efficiency precaution on governmental level.

- Suitable regulations for private buildings to establish the need for supposed isolation in a fair amount of time.

Here the most right action may be to implement taxes to the house owners who still do not have an expected isolation measures, especially, if he / she really were a fuel-electric consumer.

The collected taxes are reasonably used to isolate the buildings that required.

Then, if the flat or a building reached the required isolation, then the taxes could be finished / reduced for the people.

In the tax calculating process, the fuel / electricity consumption of the accommodator for that heating could be the prime info to take into account.

Moreover, the tax could also be cut or not taken if the resider provides himself / herself a required isolation even in one room of his / her preferred accommodation.

The regulations could be implemented in a very delicate detail so that less mistake or a crude look is possible if Allah / God wills.

.... than with a carefully detailed plan, one would lessly be wrong in the reason ; and by the revenue collected, even if the people themselves do not isolate their houses etc.; by the collected taxes the goverments could apply them even to individuals.

And by the feeling of paying more tax for the reason he/she is not isolating well his/her house; some people might incline to correct this condition.

Thanks to Allah
